Greengate

NeoSwitch Dual Technology Single Relay Vacancy Sensing Wall Switch

all connections.)

Wiring Diagram 1:

(Ground Required)

General Information

- · Read all instructions on both sides of this sheet first
- Plan all component locations carefully

Specifications -

Technology: Passive Infrared (PIR) and Ultrasonic (US) **Electrical Ratings:**

- 120 VAC:
- Incandescent/Tungsten Max. load: 6.7 amps, 800W, 50/60 Hz
- Fluorescent/Ballast Max. load: 10 amps, 1200W, 50/60 Hz

Motor Load: 1/4 HP @ 125 VAC 277 VAC:

- Fluorescent/Ballast Max. load: 9.8 amps. 2700W, 50/60 Hz
- Ballast Compatibility: Compatible with magnetic and electronic ballasts

No Minimum Load Requirement

Time Delays: Self-Adjusting, 15 seconds/test (10 min Auto), Selectable 5, 15, 30 minutes

Coverage – Install in accordance with ALL local codes

The VNW-D-1001-MV is designed for offices up to 300 square feet.

Wiring Diagram 2:

120/277 VAC single level switch dual level wiring using a toggle switch wiring diagram

Location

When installing the VNW-D-1001-MV in a new junction box, choose the switch location carefully to provide optimum coverage of the occupied area. When replacing an existing wall switch, bear in mind that there must be a clear line-ofsight between the sensor and the area to be covered. Avoid pointing the VNW-D-1001-MV directly into the hallway where it may detect passers-by

Installation

The VNW-D-1001-MV can be installed in any standard single gang box. It may be installed in the same manner as an ordinary wall switch.

- Wire the VNW-D-1001-MV as described in the wiring section
- Mount the VNW-D-1001-MV in the junction box.

Wiring Diagram 3- 120/277 VAC single level single circuit three-way wiring diagram

THREE-WAY WIRING DIAGRAM

CAUTION: If a room is wired for two circuits using two separate hot leads, it is very important to connect only one circuit per relay. Both circuits must be fed from the same phase.

Wiring

CAUTION: Before installing or performing any service on a Greengate system, the power MUST be turned OFF at the branch circuit breaker. According to NEC 240-83(d), if the branch circuit breaker is used as the main switch for a fluorescent lighting circuit, the circuit breaker should be marked "SWD." All installations should be in compliance with the National Electric Code and all state and local codes.

NOTE REGARDING COMPACT FLUORESCENT LAMPS: The life of some compact fluorescent lamps (CFLs) is shortened by frequent automatic or manual switching. Check with CFL and ballast manufacturer to determine the effects of cycling.

For indoor use only

Operating Environment:

complies with UL94VO.

Size:

Coverage: Major motion - 1000 sq. ft.

Minor motion – 300 sq. ft.

• Temperature: 32° F – 104° F (0° C – 40° C) • Relative Humidity: 20% to 90% non-condensing

Housing: Durable, injection molded housing. ABS resin

4.195" H x 1.732" W (106.553 mm x 44 mm)

• Product Housing Dimensions: 2.618" H x 1.752"

W x 1.9" D (66.5 mm x 44.5 mm x 48.26 mm)

LED Indicators: Red LED indicates PIR detection; Green

Light Level Sensing: 0 to 200 foot-candles

Mounting Plate/Strap Dimensions:

LED indicates Ultrasonic detection.

PIR Technology

Description

The sensor's segmented lens divides the field of view into sensor zones, and detects the changes in temperature that are created when a person, or part of a person as small as a hand, passes into or out of a sensor zone.

US Technology

The sensor produces a low intensity, inaudible sound. It detects occupancy from changes in the acoustic waves caused by motion, such as reaching for a telephone, turning a page in a book, walking into a room, turning in a swivel chair, etc. The sensor does not respond to audible sound.

The VNW-D-1001-MV allows the control of one load with one occupancy sensor switch.

The lights are turned ON by pressing the universally recognized light icon pushbutton. The lights stay ON as long as the sensor detects motion in the room. When the room is vacated, the lights turn OFF automatically after a preset time delay interval.

The sensor includes self-adaptive technology that continually adjusts to conditions by adjusting sensitivity and time delay in real-time. By adjusting sensitivity and time delay automatically, the sensor is maximizing the potential energy savings that are available in the particular application.

The Daylighting feature prevents lights from turning ON, when the room is adequately illuminated by natural light.

Maximum coverage area may vary somewhat according to roon shape and the presence of obstacles

The NEMA WD 7 Guide and robotic nethod were utilized to verify coverage patterns

LIGHTS WILL TURN OFF, WHEN UNIT THAT WAS TURNED ON LAST AND/OR DETECTED MOTION LAST TIMES-OUT.

Installation Instructions

Model # VNW-D-1001-MV-W

Model # VNW-D-1001-MV-V

Model # VNW-D-1001-MV-G

1. Make sure power is turned OFF at the branch circuit breaker.

2. Wire units as shown in wiring diagrams per applicable voltage requirements. (Use twist-on wire connectors for

3. Mount unit to wall box.

4. Turn power back ON at the branch circuit breaker and wait 2 minutes for the unit to stabilize.

5. Make necessary adjustments. (See Checkout and Adjustments section

6. Install wall switch plate.

A/B SWITCHING USING TOGGLE SWITCH TO TUBN OFF SECOND LOAD

DIP Switch Settings

Checkout and Adjustment -

Adjustments should be made with the HVAC system on so that the installer will be able to detect the effect of airflow on the operation of the VNW-D-1001-MV. Use only insulated tools to make adjustments.

Immediately after applying power to the lighting circuit, wait approximately two minutes for the switch to power up and stabilize.

Self-Adjust

Sensor is shipped in Self-Adjust Mode. This applies to Time Delay, US and PIR sensitivity. In preparation for the Installer Test, the Time Delay is set to 15 seconds, after the sensor is installed, powered ON and has stabilized, the unit will time-out 15 seconds after the last motion detected. Coverage and sensitivity can be confirmed by watching the Green (US) and Red (PIR) indicator LEDs on the front of the sensor, while moving around the room.

1. Walk around the room and monitor LEDs.

- 2. Stand in different parts of the room and wave vour hands. LEDs should only turn ON for one second with each motion. (If LEDs do not turn ON. go to Installer Adjustments – Sensitivity Adjustment Section)
- 3. Stand still three to four feet away from sensor for five seconds. LEDs should not turn ON. (If any LED turns ON, note LED and go to Installer Adjustments – Sensitivity Adjustments section)
- 4. Walk outside the room and wait 15 seconds for the lights to turn OFF. (If lights do not turn OFF go to Installer Adjustments Section)
- 5. Re-enter the room and manually activate the sensor. (If lights do not turn ON go to Troubleshooting Section)
- 6. At this point you can exit the room and let the sensor time-out. When the sensor times-out and is OFF with power ON for five minutes, the unit will go to a 10 minute Time Delay user mode setting.

Note: To place into Test Mode, toggle DIP Switch 12 out of its current position, wait 3 seconds, and then back into its original position.

Installer Adjustments -

Sensitivity Adjustments

Ultrasonic Sensitivity (Green LED) – Using a small flathead screw driver turn the green potentiometer so that the arrow points UP.

- 1. Stand in different areas of the room and wave your hands.
- 2. If the Green LED does not turn ON, increase the US sensitivity by turning the green potentiometer clockwise in small increments. Repeat Step 1.
- 3. Stand still three to four feet away from sensor for five seconds. LED should not turn ON.
- 4. If Green LED turns ON without motion or is constantly on decrease the US sensitivity by turning green potentiometer counter-clockwise in small decrements. Repeat Step 3.

Note: Do Not adjust sensitivity higher than necessary.

ON/OFF Button

- **PIR Sensitivity**
- 1. Stand in different areas of the room and wave your hands.
- 2. If the Red LED does not turn ON, check for any obstructions.
- 3. Stand still three to four feet away from sensor for five seconds. LED should not turn ON.
- 4. If Red LED turns ON without motion or is constantly ON adjust PIR sensitivity to 50 % by moving DIP Switch 5 up.

Field-of-view outside the space

1. Adjust PIR sensitivity to 50% by moving DIP Switch 5 up.

2. Use non-reflective tape strips to cover the portions of the sensor lens that view outside the space.

3. Adjust Ultrasonic Sensitivity.

Daylight Adjustments

The Daylighting feature prevents the lights from turning ON when the room is adequately illuminated by natural light. If there is enough light in the room regardless of occupancy, the sensor will hold the lights OFF. If there is not enough light in the room, the sensor will allow the lights to turn ON. The sensor will not allow the Daylighting feature to turn the load OFF until the space is vacant or the light level rises above the setpoint and the time delay expires. If someone attempts to turn the load ON and there is sufficient daylight available the Daylighting feature will hold the lights OFF.

Davlight

- 1. Set the light level when the ambient light is at the level where no artificial light is needed. If this feature is not needed, leave the light level at maximum (fully CW).
- 2. With the load(s) ON, put the sensor into Test Mode. To place into Test Mode, toggle DIP Switch 8 out of its current position, wait 3 seconds and then back in to its original position.
- 3. Set the Light level to minimum (fully CCW).
- 4. Let the sensor time-out so lights are OFF. Enter the space and lights should remain OFF.
- 5. Make sure not to block the sensor from the daylight source and adjust the light level potentiometer CW in small increments. (Pause 5 seconds between each adjustment)
- 6. Lights will not turn ON upon manual activation, when the ambient light level exceeds the daylight threshold setting

DIP Switches 1 and 2

Time Delay Adjustments

People who remain very still for long periods of time may need a longer time delay than the default setting of 10 minutes. As long as the self-adjusting feature is enabled, the switch will respond to each pair of falseoffs with no normal OFF in between, by alternately making slight adjustments to either time delay (by 2 minute increments) or sensitivity, so there should be no need for manual adjustment. If manual adjustment is desired, refer to Time Delay settings in DIP Switch leaend.

Reset sensor time delay to factory settings by moving

DIP Switches 1 and 2 down. (If DIP Switches 1 and 2 are already down, toggle DIP Switch 1 out of its current position, wait 3 seconds, and then back to its original position)

Override

The Override setting allows the sensor to operate as a service switch in the unlikely event of failure.

- 1. Move DIP Switch 12 up.
- 2. The pushbutton can be used to manually turn lights ON or OFF.

Warranties and Limitation of Liability –

Please refer to www.cooperlighting.com under the Legal section for our terms and conditions.
